

Ketan Tiwari

Systems + AI Automation Intern (Round 2) | Working draft | 8 October 2026

NOT READY TO SUBMIT: live account setup, links, AI-search screenshots, and Loom still need verification.

01 Lead follow-up engine

Imported-source design: all 20 fictional sessions remain in raw_leads. Fixed rules normalize emails, flag tests and incomplete rows, identify repeat contacts, choose a service, score fit from 1 to 10, and route each row. Gemini 2.5 Flash writes only eligible follow-up drafts. Hot rows create an alert record; Warm rows receive one nurture draft; Not a fit rows keep a reason and receive no draft. The automation never sends an email.

Local rule preview: **8 Hot, 4 Warm, 8 Not a fit**. L11 repeats L03 but remains a separate session; L15 is a different contact at the same company. L05 is incomplete, L07 is a test, L09 and L14 are job seekers, L16 appears to sell a competing service, L18 lacks an email, and L19 contains an instruction-injection attempt. These are local results, not a claim of a live Gemini or CRM run.

02 LinkedIn Hook Grader

A one-page Next.js flow collects name, designation, email, and the first two hook lines. Five fixed checks award 20 points each: two-line shape, 8-35 words, named subject, concrete detail, and readable length/case. Gemini returns exactly three two-line rewrites as structured JSON. The server saves each session in Supabase before calling the Make webhook. The same hook always receives the same code score.

Project evidence and links

Item	Status / link
Code	Local repository built and tested; GitHub URL pending candidate push
Live tool	Vercel deployment pending account credentials
Automation	Make scenario guide supplied; live webhook pending
CRM	Zoho draft-only integration coded; OAuth setup pending
Loom	Camera-on walkthrough pending

Implementation details, account steps, failure recovery, and a reusable Antigravity prompt are in README.md and docs/SETUP.md in the repository.

03 Ops judgement

One-page written section | Draft pending AI-platform evidence

3a. Silent bug

The Supabase leads_source_check constraint allows seven tools but omits battle_card_generator and case_study_generator. Zoho receives those leads because postToZohoForm runs first. Supabase then rejects the insert; the code only logs the error and returns undefined, so later tool input/output saves lose the lead ID. I would migrate the constraint to include both sources, make insert errors throw, and save lead plus tool data with an idempotent session key. I would add a test for every source, daily per-source count reconciliation between Zoho and Supabase, an error queue, and alerts for any failed insert. I would backfill the missing sessions after the fix.

3b. AI search

The required 15 answers have not yet been collected directly in ChatGPT, Perplexity, and Gemini. The repository contains five exact client questions and a 15-row worksheet for appearance, position, other providers, one-line answer, cited sources, and screenshot. No platform answer is fabricated in this draft.

Provisional website changes to validate against those answers:

1. Publish dedicated service pages that clearly connect each audience and geography with LinkedIn outreach, cold email, personal branding, and ICP work, linking each from relevant free tools.
2. Publish dated, client-approved case studies with method and scoped results so answer engines can cite concrete evidence.
3. Maintain a clear organization/about page with consistent business facts, service descriptions, contact details, and structured data.

Before submission: replace this draft with the copied assignment document, verified personal email and real links, 15 direct AI-search observations, screenshot links, and the completed Loom. Export that document as the final PDF and reply in the original email thread.
